UI/UX DESIGN ANALYSIS REPORT OF A MOBILE APPLICATION

App Name: ShareChat

1. Observation:

App Overview ShareChat is an Indian regional-language social media platform designed for content consumption and creation. The application primarily focuses on short videos, memes, Shagari, jokes, and status content across 15+ Indian languages including Hindi, Tamil, Telugu, Malayalam, and Marathi.

Its core purpose is to provide hyper-local, language-first entertainment. While it gained significant traction post-2018, its user engagement has declined with the rise of Instagram Reels, Moj, and Josh, which offer superior content recommendation and modern UI. Currently, its primary user base is concentrated in Tier 2 and Tier 3 cities.

2. Navigation Analysis:

Upon launching, the app prompts language selection followed by a personalized "For You" feed.

Bottom Navigation consists of 5 tabs: Home, Trending/Explore, Create (+), Chat, and Profile.

Issues Identified:

- *Inconsistent Back Behavior:* Navigating back from a post refreshes the entire feed, causing loss of context and scroll position.
- *Weak Information Architecture:* Explore and Search filters lack clarity. Language and category filters are overlapping and confusing.
- *Intrusive Elements:* Frequent pop-ups related to coins, chat invites, and ads disrupt the primary navigation flow.
- *Searchability:* Search functionality is basic with no advanced filters for content type, duration, or creator.

3. Layout Organization*:*

a) Visual Hierarchy: The visual hierarchy is weak. All content cards (videos, images, text-based Shagari) are given equal weightage. Primary Call-to-Actions (CTAs) like Follow, Like, and Share are not visually emphasized.

Users cannot differentiate between high-priority and secondary information.

b) Grid System: The main feed uses a single-column layout. The Explore page uses a 2-column grid, but thumbnail sizes are inconsistent, leading to uneven alignment and a cluttered appearance.

c) White Space: The application suffers from a lack of white space. Screens are densely packed with content, stickers, and advertisements, resulting in cognitive overload.

d) Line Spacing: Line-height for text content is approximately 1.1, which is below the recommended 1.4-1.6. Text placed over colorful image backgrounds has poor contrast, affecting readability.

4. Color Scheme Background Color*:*

(White) for the main feed. Meme and Shagari templates use highly saturated colors (pink, yellow, cyan).

Primary Color: ShareChat Blue used for CTAs, logos, and hashtags. The shade appears outdated and overly bright.

Text Color: Primary text is Black, secondary text is grey hashtags are in Blue. The simultaneous use of multiple bright background colors creates a non-premium, cheap aesthetic.

Recommendations:

- Adopt a more premium, muted primary blue.
- Use pastel or neutral card backgrounds for text-based posts to ensure contrast.
- Maintain a consistent color system - limit to 1 primary, 1 secondary, and 1 accent color as per Material Design 3 guidelines.

5. Typography *:*
usernames and section titles.

Body: Sans-serif Regular for captions, Shagari, and comments.

Issues Identified:

- Minimal size differentiation between headings and body text.

- Poor rendering of regional language fonts, especially Tamil and Malayalam, which appear overly bold and pixelated.
- Inconsistent spacing between emoji and text, and lack of clear distinction for clickable hashtags.

6. User Flow:

App launch -> Language selection -> Home feed (Login not mandatory - positive).

Action: User scrolls through the feed and clicks on a piece of content.

Input: User types "Tamil memes" in the search bar.

Selection: User interacts with Like, Comment, or WhatsApp Share options.

System Feedback (Playback): System plays the video and updates engagement counts. However, feedback is limited to small toast messages.

Task Completion: User clicks Create (+) -> Uploads media -> Adds caption -> Posts. The creation tools are basic with limited editing, filters, and no clear progress

indicator or proper confirmation page after successful posting.

The overall flow involves 4-5 steps, which is longer than competitors.

7. Strength and Weakness Analysis

Strengths:

1. Excellent regional language support (15+ languages) - key differentiator.
2. Lightweight application optimized for low-end Android devices.
3. Allows guest browsing without mandatory login.
4. Easy WhatsApp integration for sharing content.
5. Strong community-driven, hyper-local content library.

Weaknesses:

1. Navigation is inconsistent and suffers from forced refreshing issues.
2. Cluttered layout with poor visual hierarchy and lack of white space.

3. Outdated and over-saturated color scheme.
4. Poor typography, line spacing, and regional font rendering affects readability.
5. Excessive advertisements and coin-related pop-ups.
6. Weak recommendation algorithms and lack of content quality control leading to repetitive content.
